P-GLYCOPROTEIN INHIBITOR, METHOD FOR PREPARING THE SAME
AND PHARMACEUTICAL COMPOSITION COMPRISING THE SAME

5 FIELD OF THE INVENTION

The present invention relates to an effective p-glycoprotein inhibitor and a pharmaceutically acceptable salt thereof, a method for preparing the same and a pharmaceutical composition containing the same as an active ingredient.

10

BACKGROUND OF THE INVENTION

It is known that many anticancer agents, e.g., vinca alkaloid, anthracycline, epipodophilotoxin, paclitaxel and docetaxel, become in effective when administered to a patient having multi-drug resistance (MDR) which has been caused by the presence of overexpressed p-glycoprotein in the patent. P-glycoprotein inhibits intracellular accumulation of the administered anticancer agent by pumping the agent out of the cell (D.W. Shen, et al., *Science* (1986), 232, 643-645; and Schinkel, et al., *Cell* (1994), 77, 491-502). Accordingly, there have been numerous attempts to enhance the bioavailability of the above-mentioned agents by incorporating therein an inhibitor of p-glycoprotein.

Since the conventional p-glycoprotein inhibitors, such as verapamil and cyclosporin A, cause serious adverse effects, e.g., blood pressure decline and immunity suppression, a number of new p-glycoprotein inhibitors such as piperidine-2-carboxylate, acridine, piperazine-2,5-dion, anthranilic acid and methanodibenzosuberan derivatives have been developed. However, such newly introduced p-glycoprotein inhibitors have been reported to have toxicity and other problems (see PCT Publication No. WO 94/07858; WO 92/12132; WO 96/20180 and 98/17648; and WO 98/22112).

30 Accordingly, the present inventors have endeavored to develop a

p-glycoprotein inhibitor that is free from the above problems, and have found a novel compound which markedly enhances the bioavailability of anticancer agents by suppressing p-glycoprotein.

5 SUMMARY OF THE INVENTION

Accordingly, it is an object of the present invention to provide a compound which can be used as an effective p-glycoprotein inhibitor for enhancing the bioavailability of an anticancer agent while minimizing adverse effects.

10 It is another object of the present invention to provide a process for preparing such compound.

It is a further object of the present invention to provide a pharmaceutical composition containing such compound.

15 DETAILED DESCRIPTION OF THE INVENTION

In accordance with one aspect of the present invention, there is provided a compound of formula (I) and a pharmaceutically acceptable salt thereof:

(I)

wherein,

R₁ is aryl, heteroaryl, acrylaryl, acrylheteroaryl, heterocycloalkenyl, or carbocyclo, which is optionally substituted with one or more substituents selected from C₁₋₅ alkyl, hydroxy, C₁₋₅ alkoxy, halogen, trifluoromethyl, nitro and amino;

R₂, R₃, R₄, R₅, R₆, R₇, R₈, R₉, R₁₀ and R₁₁ are each independently hydrogen, hydroxy, halogen, nitro, C₁₋₅ alkyl or alkoxy, R₆ and R₁₁ being optionally fused

together to form a 4 to 8-membered ring;

m and n are each independently an integer ranging from 0 to 4; and

X is CH₂, O or S.

5 Unlike the conventional p-glycoprotein inhibitors, e.g., cyclosporin A, cinchonine and verapamil, the compound of formula (I) itself has no pharmacological activity, and, consequently, causes no side effects, while enhancing the bioavailability of anticancer agents by inhibiting the activity of p-glycoprotein.

10 In the compound of formula (I) of the present invention, preferred R₁ is unsubstituted or substituted phenyl, pyridine, pyrazine, quinoline, isoquinoline, quinazoline, quinoxaline, pyrazole, imidazole, triazole, oxazole, thiazole, oxadiazole, thiadiazole, benzthiazole, benzoxazole, chromone, quinolone, cinnamic or quinoline acryl.

5 Test Example 1: Inhibition activity of inventive compound against p-glycoprotein

In order to investigate the bioavailability each of the inventive compounds as an inhibitor of p-glycoprotein, its cellular toxicity was measured using MCF-7 cell and MCF-7/Dox cell, which is MCF-7 expressing p-glycoprotein.

10 The cells were subcultured in 5% FBS (fetal bovine serum)/RPMI1640 medium supplemented with glutamine 2 mmol, sodium bicarbonate 3.7 g/L and gentamicin 10 mg/L at 37°C in 5% CO₂ incubator under 100% humidity, and collected using a 0.25 % trypsin solution containing 3 mM 1,2-cyclohexandiamine tetraacetic acid.

15 The collected cells were plated on a 96 well flat-bottomed plate at a density of 2×10^3 cells/well, and incubated in the same medium for 24 hours. Paclitaxel, an anticancer agent, was diluted with the same medium to obtain $10^{-11} \sim 10^{-6}$ M test solutions. After removing the culture media, each well was treated with 100 μ l of a test solution, alone or in combination with 50 nM each of the test compounds of
20 Examples 1 to 30. After incubating for 72 hours, the culture medium was removed, each well was treated with 10% trichloroacetic acid for 1 hour to fix the cells, washed with water, and dried at room temperature. After adding a dyeing solution containing 1% acetic acid with 0.4% SRB (sulforhodamine B) thereto, the wells were kept at room temperature for 30 min, and washed with 1% acetic acid to
25 remove remaining SRB. 10 ml of trisma base solution having pH 10.3~10.5 was added thereto, and the absorbance at 520 nm of each well was measured using a microplate reader to evaluate ED₅₀, the drug concentration at which the growth of the cancer cells was inhibited to the extent of 50%. Also, the enhancement of the anticancer activity of paclitaxel against MCF7/Dox (resistant cancer cells) was
30 measured by determining ED_{50}^{PAC}/ED_{50} , wherein ED_{50}^{PAC} is the value determined

for the case of paclitaxel alone. The results are shown in Table II.

As shown in Table II, the paclitaxel has markedly higher cytotoxicity against MCF-7/Dx cells in case of treating in combination with the compounds of Examples

than when treated alone, and it can be seen that the inventive compounds of formula (I) effectively suppress the activity of p-glycoprotein even at a low concentration of 50 nM.

5 Test Example 2: *In vivo* absorption of orally administered paclitaxel

In order to investigate the activity of the inventive compounds prepared in Examples, *in vivo* absorption tests were carried out as follows.

Twenty-five 14- to 15-week-old Sprague-Dawley rats were fasted for over
10 24 hours while they were allowed free access to water, and then, divided into 4 groups of 5 to 8 rats each. Three of the former test groups were orally administered with 20 mg/kg body weight of paclitaxel (6 mg of paclitaxel/0.5 ml of cremophor EL + 0.5 ml of ethanol) and each of the compounds of Example 1, 21 and 22 (12 mg of the compounds of Examples/4 ml of 5% dextrose + 1.2 mcg of methanesulfonic
15 acid), and the control group was administered with a vehicle (4 ml of 5%-dextrose + 1.2 mcg of methanesulfonic acid) and 20 mg of paclitaxel (composition: 6 mg of paclitaxel in 0.5 ml of cremophor EL + 0.5 ml of ethanol). Blood samples were taken directly from the heart of each rat before and 1, 2, 4, 6, 8 and 24 hours after the administration.

20 Each of blood samples was centrifuged at 12,000 rpm to obtain a serum sample, 200 μ l of which was mixed with 400 μ l of acetonitrile (an internal standard) and the mixture was shaken to obtain an extract. The extract was centrifuged at 12,000 rpm, 4°C for 5 min to obtain a supernatant. 50 μ l of the supernatant was subjected to semi-micro HPLC under the following conditions:

- 25
- semi-micro HPLC system: SI-1 model(Shiseido)
 - analysis column: Capcell Pak C₁₈ UG120(5 μ m, 1.5 x 250mm, Shiseido)
 - pre-column: Capcell Pak C₁₈ MF Ph-1(4.6 x 10mm, Shiseido)
 - concentration column: Capcell Pak C₁₈ UG120(5 μ m, 1.5 x 35mm, Shiseido)
 - mobile phase for pre-column: 20 % acetonitrile
 - 30 - mobile phase for analysis column: 55 % acetonitrile

- injection volume: 5 μl
- flow rate: 5 $\mu\text{l}/\text{min}$.
- detector: 227 nm

The time-dependent changes of the in-blood paclitaxel concentrations are

not readily absorbable in the digestive tract.
